

DISPLAY SYSTEM FOR DISPLAYING SUB-TITLES

Abstract

A display system embedded in a media player has an on-screen display (OSD) function for displaying an operation status of the player. When the player obtains a medium signal and outputs a video signal within the medium signal to a screen for displaying video, the invention utilizes software-parsing to parse a subtitle signal within the medium signal, and obtains a text signal within the subtitle signal. Then the subtitle text can be displayed as OSD text using the OSD function of the player.
